#### PROTHROMBIN TIME, PLASMA

Prothrombin time (PT) is a non-specific indicator of the extrinsic coagulation pathway. pt is expressed as normalized ratio(INR) to improve comparability of results obtain in different laboratories using different thromboplastin reagents. deficiencies of fibrinogen, prothrombin and factor vii, ix & x result in prolonged PT. some of the common causes of a prolonged pt are vitamin k deficiency, oral anticoagulant therapy, obstructive liver disease, disseminated intravascular coagulation(DIC), heparin therapy, and malabsorption stated leading to vitamin k deficiency.

ICMR Registration Number for COVID-19: SERILABPISDD

**PATIENT RESULT SUMMARY**

**Name of Assay:** nCoV-19 (COVID-19) Real Time RT-PCR RNA Qualitative Assay

**Name of Technology:** TaqMan Real Time RT-PCR

**Specimen Type:** Nasopharyngeal swabs/Oropharyngeal swabs

Test Description	CT Values	Units	Biological Reference Range
E Gene	NOT DETECTED		
RdRp Gene	NOT DETECTED		

**Final Result: NEGATIVE for nCoV-19(COVID-19) RNA**

**Interpretation:**

- Positive result is considered a positive test result for nCoV-19(COVID-19). This shows that RNA from novel coronavirus (nCoV-19) was detected and patient should be considered infected with corona virus.
- Negative result for nCoV-19(COVID-19) means that nCoV-19(COVID-19) RNA was not present in the specimen.

**Limitation:**

- The result (negative or positive) of this test must always be correlated with clinical status and history of the patient and other relevant data and should not be used alone for the interpretation.
- Positive results but do not rule out bacterial infection or co-infection with other viruses. & Negative results do not preclude COVID-19 and should not be used as the sole basis for patient management decisions.
- If the virus mutates in RT-PCR target region, nCoV-19 may not be detected or may be detected less predictably. Inhibitors or other types of interference may produce a false negative result. Kindly correlate the test results with clinical findings.
- The performance of this test has not been established for monitoring treatment of nCoV-19(COVID-19) infection.
- False positive results may happen from cross-contamination between patient samples, specimen mix up and RNA contamination during product handling.
- Possible cause of false negative results: Inadequate specimen quality, specimen collected too early or too late, Specimens improperly handled or transported, contamination or viral genomic mutation, Presence of PCR inhibitors, Antacid administration prior to testing.

**Note:** Test has been performed using ICMR approved kit
